The Slammer module (5840) enhances the consistency and speed of activating valves and solenoids. It can repeatedly fire a valve more frequently than what can normally be achieved with a normal I/O supply.

The module “slams” the solenoid valve with a short pulse of:
- 45VDC or
- 60VDC or
- 75VDC or
- 90VDC

and quickly drops to 24VDC for the duration of the output signal. The high-voltage pulse makes the solenoid react faster and more consistently, while the quick drop in voltage saves the solenoid from excessive current, preventing damage to the valve.

The Slammer is especially useful in open loop flying die applications, where reducing the time between the shear output activating and the shear contacting the material can increase the efficiency of the shear’s reaction time, creating a more accurate cut.

**SPECIFICATIONS**

**Input:**
24VDC at 10 Amps

**Max Output:**
8 Amps

**Temperature Range:**
0° - 57° C (32° - 135° F)

**Recommended Output Voltages:**

<table>
<thead>
<tr>
<th>Coil Resistance</th>
<th>Slammer Output Voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-18 ohms</td>
<td>90v</td>
</tr>
<tr>
<td>18-24 ohms</td>
<td>75v</td>
</tr>
<tr>
<td>24-100 ohms</td>
<td>60v</td>
</tr>
<tr>
<td>100-250 ohms</td>
<td>45v</td>
</tr>
</tbody>
</table>

*Note: If coil resistance is less than 3 ohms or greater than 250 ohms, there is no advantage to using the slammer and may even create problems. If you need to improve valve reaction time, try increasing slammer output voltage no more than one step per the table above.*
